

All events coded in MatchInsight will feed into MI Viewer, which is one of the most advanced post-match and scouting analysis tools being used today. A variety of outputs are automatically populated and displayed in a variety of formats (including statistical data, distribution maps and video) to allow for a comprehensive tactical analysis of a match.

Statistical data, distribution maps and video allow for a comprehensive tactical analysis

Analyse the game through objective statistical data and distribution maps, with the ability to interact with the video footage to 'view' data immediately.

No more trawling through video tapes! Perform immediate searches for critical match incidents, including crosses, shots, goals, tackles, passes and possession regains.

Conduct individual, team and playing unit analysis, with the option to export to external media and produce automated reports.

MatchViewer is used widely in the Premiership, Championship and by International teams to analyse strengths, weaknesses, patterns of play, changes of possession and set-pieces.

MatchInsight now enables users to produce exactly the same outputs so university and lower league teams can benchmark their performance against professional players!
